Features and Use Cases for Sprint 1

Feature 1: User Data and Storage

Use case: Developer wants a way to store Data

- As a Dev, I want a place to store User Data.
- As any User, I want my data to be stored securely

Acceptance Criteria: data is stored somewhere (e.g Firestore data model / database)

Feature 2: Authentication and role-based access

Use case: User wants to sign up or login

- As any user, I want to be redirected to login if I'm not signed in, and to log out, so that the portal stays secure.
- As a broker, I want to log in with email and password so that I can access my client files.
- As an underwriter, I want to log in with email and password, so that it would land on a portfolio-wide view so that I can oversee all applications.

Acceptance Criteria: When signing up there are a broker or underwriter option buttons, if broker was selected, when logged in, show only what broker can see and same for underwriter

Feature 3: Origination pipeline view

Use case: User monitors the loan pipeline.

- As a broker, I want to filter by status and LTV band so that I can find relevant files quickly.
- As an underwriter, I want to see all applications in a table with status, LTV and risk tier so that I can prioritize work.

Acceptance Criteria: After a broker or underwriter logs in, what do they see? status, LTV band, and risk tier.
