Core Sprint Retrospective

Name: Sam Buckley Barrett

ID: R00266058

Sprint goal

The sprint focused on setting up the foundation of the core by using Firebase Authentication & Firestore. The goal was to cover CORE-01 to CORE-08 in the product backlog which included user access, profiles, roles, application data, status & broker assignments.

What went well

Separating the CORE work into 8 sections made the required features clearer.The use cases helped connect the stored data to the screens used by borrowers and staff. The acceptance criteria also made it clearer what each feature needs to be done before I could consider it done.

What proved difficult

At the start, being unfamiliar with firebase I was unsure how the the firebase setup related to the backend code and the mobile and the web. A registration test produced a profile record in Firestore without a confirmed account in Firebase Authentication. This made me need to check account creation and profile storage separately.

What I learned

I learned that Firebase Authentication manages account, while Firestore stores profiles & application data. Which is why linking them through the user ID is important for identifying users and controlling access.
