Core Backlog Sprint 1

Name: Sam Buckley Barrett

ID: R00266058

CORE 01 Registration and login

Feature: Authentication and user management

User story: As a user, I want to register and log in so that I can securely access the AL system.

Tasks:

- Connect registration and login to Firebase Authentication.
- Handle invalid credentials and authentication errors.
- Return the authenticated user identifier.

Acceptance criteria: User can register and log in using valid credentials. Invalid credentials are rejected, and the system identifies the authenticated user.

Dependencies: Firebase Authentication

CORE 02 User profile storage

Feature: Authentication and user management

User story: As the system, I want to store user profile information so that borrowers, brokers and bank officials can be identified.

Tasks:

- Define the user profile structure.
- Save a profile in Firestore using the authenticated user ID.
- Retrieve the saved profile.

Acceptance criteria: Required profile information is stored and linked to the authenticated user. The saved profile can be retrieved successfully.

Dependencies: CORE-01, user profile structure, Firestore

CORE 03 Role management

Feature: Authentication and user management

User story: As the system, I want to identify whether a user is a borrower, broker or bank official so that appropriate access can be provided. Access is restricted according to the user's role.

Tasks:

- Define borrower, broker and bank official roles.
- Store and retrieve the role with the user profile.
- Apply role checks to protected operations.

Acceptance criteria: Each user has a defined role stored in Firebase. The role can be retrieved when the user logs in.

Dependencies: CORE-02, user roles, access rules

CORE 04 Mortgage application storage

Feature: Mortgage application data

User story: As the system, I want to store mortgage applications so that applications can be processed and reviewed.

Tasks:

- Define the application data structure.
- Create and save an application with a unique ID.
- Retrieve the application by ID.

Acceptance criteria: A new application can be created with a unique ID. The application can be retrieved from Firebase.

Dependencies: Authentication, application data structure, Firestore

CORE 05 Financial data storage

Feature: Mortgage application data

User story: As the system, I want to store income, existing debt, deposit and requested mortgage term so that the application contains the required financial information.

Tasks:

- Define and validate the required financial fields.
- Save the fields against the correct application ID.
- Retrieve the saved financial details.

Acceptance criteria: All required financial fields can be stored and associated with the correct application. The stored data can be retrieved successfully.

Dependencies: CORE-04, financial data structure, input validation

CORE 06 Property data storage

Feature: Mortgage application data

User story: As the system, I want to store property specifications so that the property can be assessed by the valuation system.

Tasks:

- Define and validate property fields.
- Store location/county, area, bedrooms, property type and BER.
- Link the property details to the correct application.

Acceptance criteria: Location/county, area, bedrooms, property type and BER rating can be stored against the correct application.

Dependencies: CORE-04, property data structure, input validation

CORE 07 Application lifecycle status

Feature: Application tracking and broker assignment

User story: As the system, I want to maintain the application's lifecycle status so that its progress can be tracked.

Tasks:

- Define the lifecycle status values.
- Implement status storage and updates under the lifecycle rules.
- Retrieve the current application status.

Acceptance criteria: An application can have statuses such as Applied, AI Deliberated, Underwriter Approved, Funded and Closed. Its status can be updated and retrieved.

Dependencies: CORE-04, application lifecycle rules, Firestore

CORE 08 Broker assignment

Feature: Application tracking and broker assignment

User story: As the system, I want to associate an application with a broker so that the correct broker can manage the application.

Tasks:

- Identify an existing broker profile.
- Save the broker ID against an application.
- Retrieve the assigned broker with the application.

Acceptance criteria: An application can be assigned to a broker. The assignment is stored, and the assigned broker can be identified when the application is retrieved.

Dependencies: CORE-03, CORE-04, broker profile
